In the claims:

Claims 5, 7, 8 and 12 have been replaced with the following corresponding claims:

5. (Amended) A [The] router device [of claim 1] for transferring datagrams among networks comprising:
network interfaces connected with networks including at least one virtual connection oriented network;
a memory [for storing] configured to store a correspondence between a virtual connection identifier and a transfer target network interface;
a connection identifier analysis [means for determining] unit configured to determine a transfer target network interface for a datagram entered from a virtual connection, by referring to the memory according to a virtual connection identifier of the virtual connection; and
a transfer [means for transferring] unit configured to transfer the datagram to the transfer target network interface determined by the connection identifier analysis unit,
wherein the memory also stores a correspondence between [a] the virtual connection identifier and a next hop network layer address to be used in a case where network connected with the transfer target network interface is a non-virtual connection oriented network.
7. (Amended) A [The] router device [of claim 1] for transferring datagrams among networks comprising:
network interfaces connected with networks including at least one virtual connection oriented network;
a memory [for storing] configured to store a correspondence between a virtual connection identifier and a transfer target network interface;
a connection identifier [means for determining] analysis unit configured to determine a transfer target network interface for a datagram entered from a virtual connection, by referring to the memory according to a virtual connection identifier of the virtual connection; and
a transfer [means for transferring] unit configured to transfer the datagram to the transfer target network interface determined by the connection identifier analysis unit; and
a datagram analysis unit configured to register [means for registering] in advance a correspondence between a datagram content and a transfer target network interface, and to determine [determining] a transfer target network interface for the datagram according to a datagram content of the datagram when the memory does not store the transfer target network

interface in correspondence to the virtual connection identifier of the virtual connection[:],

wherein the transfer unit [means] transfers the datagram to the transfer target network interface determined by the datagram analysis unit [means] when the memory does not store the transfer target network interface in correspondence to the virtual connection identifier of the virtual connection.

8. (Amended) A [The] router device [of claim 1] for transferring datagrams among networks comprising:

network interfaces connected with networks including at least one virtual connection oriented network;

a memory [for storing] configured to store a correspondence between a virtual connection identifier and a transfer target network interface;

a connection identifier analysis [means for determining] unit configured to determine a transfer target network interface for a datagram entered from a virtual connection, by referring to the memory according to a virtual connection identifier of the virtual connection; and

a transfer [means for transferring] unit configured to transfer the datagram to the transfer target network interface determined by the connection identifier analysis unit, wherein:

the memory also stores a correspondence between a virtual connection identifier and a quality of service;

the connection identifier analysis unit [means] also determines a quality of service for the datagram by referring to the memory according to a virtual connection identifier of the virtual connection; and

the router device further comprises:

a scheduler configured to apply [means for applying] a priority control for datagrams to be transferred by the router device according to the quality of service determined by the connection identifier analysis unit [means], such that the transfer unit [means] transfers the datagram to which the priority control is applied by the scheduler [means].

12. (Amended) A [The] router device [of claim 1] for transferring datagrams among networks comprising:

network interfaces connected with networks including at least one virtual connection oriented network;

a memory [for storing] configured to store a correspondence between a virtual connection identifier and a transfer target network interface;

a connection identifier analysis means for determining] unit configured to determine a transfer target network interface for a datagram entered from a virtual connection, by referring to the memory according to a virtual connection identifier of the virtual connection; and

a transfer [means for transferring] unit configured to transfer the datagram to the transfer target network interface determined by the connection identifier analysis unit; and

a datagram processing unit configured to apply network layer processing to the datagram to be transferred by the router device, wherein the datagram processing unit [means] is separately provided for each network interface.
